INITIAL SYSTEM SETUP

Before proceeding with initial system setup, verify that the following steps have been completed:

* Verify that the system air feed piping is connected to the location indicated on the trim drawing.
* Verify that an approved control panel is installed for proper system operation.

THE FOLLOWING INSTRUCTIONS APPLY TO SOLENOIDS THAT ARE CLOSED (DE-ENERGIZED). IF THE SOLENOIDS ARE OPEN (ENERGIZED), RESET THE CONTROL PANEL BEFORE ATTEMPTING TO PLACE THE SYSTEM IN SERVICE.

Step 1:
Confirm that all system drains are shut and that the system is free of leaks.

Step 2:
Confirm that the system has been depressurized. The gauges should indicate zero pressure.

Step 2a:
If a Series 746-LPA Dry Accelerator is installed, confirm that the isolation ball valve is closed.

Step 2b:
If a Series 746-LPA Dry Accelerator is installed, open the 1/4-turn vent ball valve.

Step 3:
Confirm that the alarm test ball valve is closed.

Step 4:
Open the water supply main control valve fully.

Step 5:
Close the water supply main drain valve when a steady flow of water occurs.

Step 6:
Open the water supply main drain valve slowly until water flows steadily from the open water supply main drain valve.

Step 7:
Open the charging line ball valve. Allow water to flow through the auto drain tube.

Step 8:
Open the manual pull station valve to bleed off any air that is present, then close the manual pull station valve. Verify that the charge line pressure is equal to the supply pressure and that the auto drain is set by pulling up on the auto drain sleeve. Verify that no water is draining from the Series 776 Low-Pressure Actuator. NOTE: The Auto Vent Screw should seal and remain in the set ("UP") position.

Step 9:
When the system reaches approximately 10 psi/69 kPa/0.7 Bar, and no additional moisture is being released from the Auto Vent, pull up on the Auto Vent Sleeve of the Series 776 Low-Pressure Actuator. NOTE: The Auto Vent Screw should seal and remain in the set ("UP") position. When system air pressure is established, close the fast-fill ball valve on the Actuator.

Step 10:
Open the charge line ball valve. Allow water to flow through the auto drain tube.

Step 11:
Open the water supply main control valve when a steady flow of water occurs.

Step 12:
Open the water supply main control valve slowly until water flows steadily from the open water supply main drain valve.

Step 13:
Close the water supply main drain valve.

Step 14:
Open the water supply main control valve fully.

Confirm that all valves are in their normal operating positions (refer to the table below).

WATER FLOW ALARM TEST

Perform the water flow alarm test on a frequency required by the current NFPA-25 code. The authority having jurisdiction in the area may require these tests on a more frequent basis. Verify these requirements by contacting the authority having jurisdiction in the affected area.

1. Notify the authority having jurisdiction, remote station alarm monitors, and those in the affected area that the water flow alarm test will be performed.
2. Open the water supply main drain valve fully to flush the water supply of any contaminants.
3. Close the water supply main drain valve.
4. Open the alarm test ball valve. Confirm that mechanical and electrical alarms are activated and that remote monitoring stations, if provided, receive an alarm signal.
5. Close the alarm test ball valve after verifying proper operation of all alarms.
6. Push in the ball drip plunger on the alarm manifold assembly to verify that there is no pressure in the alarm line.
7. Verify that all alarms stopped sounding, that the alarm line drained properly, and that remote station alarms reset properly.
8. Confirm that the ball drip on the alarm manifold assembly is not leaking water or air.
9. Provide test results to the authority having jurisdiction, if required.

### NORMAL OPERATING POSITIONS FOR VALVES
